

AI Engineer – Knowledge Graphs & Agentic Systems

Location: Bangalore, India

Experience: ~2 Years

Type: Full-Time

About Parse.ai

Parse.ai is an Agentic platform purpose-built for Lending. It is contextualized with domain knowledge (Knowledge Graphs), Algorithms, and a Reasoning Layer required for Lending Data Flows, making it **Deterministic and Auditable**. Users can generate Financial Analysis, Credit Underwriting, Credit Memos, Peer Benchmarks, Portfolio Analytics (vintage analysis, yields by cohort, PAR, roll rates, collections analytics, and more), Customer Growth models (Cross Sell, Upsell, Churn, propensity models), and Predictive models (PD, LGD, EAD, payment propensity, etc.)—all in minutes with just a drag and drop of data in its source format. **No coding, Data Engineering, or Data Science capabilities required.**

With Parse.ai, lenders can reduce their NPLs, lower Provisions, and increase portfolio yield significantly—addressing what is at the core of lending.

The Opportunity

We are building the **Knowledge Graph and Reasoning Layer** for the entire lending tech stack—and eventually, the entire banking tech stack. This is a ground-floor opportunity to shape the AI infrastructure that will power financial decision-making at scale.

If you thrive at the intersection of cutting-edge AI research and real-world product impact, this role offers tremendous scope for learning, experimentation, and ownership.

What You'll Do

- Design, build, and optimize **multi-agent systems** that orchestrate complex lending workflows
- Architect and expand our **Knowledge Graph** to encode domain expertise across credit, risk, and banking operations
- Develop and refine the **Reasoning Layer** that enables deterministic, auditable AI outputs

- Collaborate closely with domain experts to translate lending logic into scalable AI components
 - Ship production-grade code that directly impacts customers and drives measurable value
 - Stay current with advances in LLMs, agentic frameworks, and graph-based AI—and bring relevant innovations into our stack
-

What We're Looking For

Experience & Skills

- ~2 years of hands-on experience building **multi-agentic platforms** or complex AI/ML systems
- Demonstrated experience working with **Knowledge Graphs** (construction, querying, reasoning)
- Sharp programming skills in Python; familiarity with frameworks like LangChain, LangGraph, CrewAI, or similar
- Strong problem-solving ability—you break down ambiguous problems and ship solutions fast
- **Native Vibe Coder:** You leverage AI-assisted development tools fluently to amplify your output

Mindset

- A relentless drive to **create value**—for customers, for the team, for the product
 - Curiosity to go deep into lending/banking domain and become a domain-aware engineer
 - Comfort with ambiguity and the pace of an early-stage startup
 - Strong ownership mentality—you see things through from idea to production
-

Why Join Parse.ai?

- **Foundational Impact:** Build the AI backbone for an industry-defining platform
 - **Learning & Research:** Deep exposure to knowledge graphs, reasoning systems, and agentic AI in a high-stakes domain
 - **Domain Mastery:** Become fluent in lending and credit—a space where AI is creating massive disruption
 - **Ownership:** Small team, big problems, direct line to customers and outcomes
 - **Growth:** As we scale from lending to banking, your scope scales with us
-

How to Apply

Send your resume along with links to any relevant projects, GitHub repos, or demos that showcase your work in agentic systems or knowledge graphs.

We value builders. Show us what you've shipped.
